

# GENTAG

GENTAG is at the very center of one of the most important wireless innovations in personal health and diagnostics. Our vision is to combine disposable wireless sensors with consumer NFC cell phones to make healthcare and diagnostics accessible and affordable to anyone worldwide.

The GENTAG technology is compatible with most cell phones, with PCs, tablets, or Wi-Fi nodes. Sensor communication ranges from 1 inch to 15 miles are possible, depending on the specific need or application. GENTAG's software allows secure closed-loop personal monitoring, or allows secure encrypted sensor data to be sent remotely to a personal physician, a hospital or a records storage system such as Microsoft® HealthVault® or Google® Health. The patient or consumer decides what application to select and what to do with their data.

NFC cell phones or NFC tablets combined with sensors can be used as preventive devices not only for medicine but also for any consumer, industrial or Homeland Security application. The GENTAG technology allows seamless use of sensors with cell phones for virtually any application - anywhere.
